No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                              Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             80

C;Species: Homo sapiens (man) RESULT 10 THUNW Comment: This a Bence Jones protein protein New (lambda type). Subg 09-Jul-2004

A; Map position: 22q11.2-22q11.2
C; Complex: An immunoglobulin herrotetramer subunit consists of two identical light (kap C; Complex: An immunoglobulin bome cases, such as IgA and IgM, the subunits associate into la L; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: blocked amino end; heterotetramer
F; 15-91/Dömain: immunoglobulin homology < IMM>
F; 1, Modified site: blocked amino end (Gln) (probably pyrrolidone carboxylic acid) #status
F; 22-89/Disulfide bonds: #status predicted

Novel neuromodulatory agent (a human IgM monoclonal antibody), promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system, useful to treat post-infectious encephalomyelitis.

Claim 23; Fig 18; 219pp; English.

#X#X#X#X####XXXDDDDDDDD The invention provides a neuromodulatory agent (I) capable of promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system (CNS). (I) is capable of inducing remyelination, "promoting cellular proliferation of glial cells, and promoting C2+ signaling with oligodendrocytes. An humanised antibody to (I) can be selected from antibody sHIGM2 (LYM 22), ebvHigM MSI19D10, ebv HIGM CB2D58, AKJR4, CB21E12, CB21E7 or MSI19E5. (I) is useful for stimulating remyelination of CNS axons, stimulating proliferation of glial cells in CNS axons, or treating demyelinating disease of CNS in a mammal in need of such therapy. (I) is capable of binding to structures and cells within

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CNS. (I) is preferably useful for treating a demyelinating disease of CNS of a mouse infected with Strain DA of Theller's murine encephalomyelitis (TMEV) or for treating a human being having multiple sclerosis, or a human or domestic animal with a viral demyelinating disease, or a postneural disease of CNS. (I) is also useful for an in vitro method of neural disease of CNS. (I) is also useful for an invitro method of is also useful for stimulating remyelination of CNS axons. The antibodies are useful for preventing infection by a bacterium, virus or like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               are useful for preventing infection by a bacterium, virus or like pathogen that causes demyelination or other neurodegenerative condition in a subject. Methods where (I) is administered to a pathent are useful for treating multiple sclerosis, Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), a viral demyelinating disease, CNS diseases, and other conditions in the CNS where nerves are damaged as by trauma. The present sequence represents the sHigM22 light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neuromodulatory; central nervous system; CNS; sHIgM22; LYM 22; AKJR4; ebvHigM MsI19D10; ebv HIgM CB2bG8; CB2iE12; CB2iE7; MSI19E5; virucide; antiparkinsonian; neuroprotective; nootropic; vulnerary.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC signaling with oligodendrocytes. An humanised antibody to (I) can be selected from antibody sHigM22 (LYM 22), abvHigM MsI19D10, abv HigM CC CB2bG8, AKJR4, CB2iE12, CB2iE7 or MsI19E5. (I) is useful for stimulating CC remyelination of CNS axons, stimulating proliferation of glial cells in CC CNS axons, or treating demyelinating proliferation of glial cells in CC CNS axons, or treating demyelinating proliferation of glial cells in constant of such therapy. (I) is capable of binding to structures and cells within CC CNS. (I) is preferably useful for treating a demyelinating disease of CNS of a mouse infected with Strain DA of Theller's murine encephalomyelitis (CC (TMEN) or for treating a human being having multiple sclerosis, or a post-numan or domestic animal with a viral demyelinating disease, or a post-cc are useful for stimulation of glial cells from mixed cell culture. (I) is also useful for stimulating remyelination of CNS axons. The antibodies are useful for preventing infection by a bacterium, virus or like can subject. Methods where (I) is administered to a patient are useful conditions in subject. Methods where (I) is administered to a patient are useful conditions a subject. Methods where (I) is administered to a patient are useful conditions in the CNS axons. The present sequence represents the sHigM22 light condition variable region clone I amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 112;

Human diagnostic and therapeutic pprotein SEQ ID NO:4542

New human immunoglobulin M antibody for treating or preventing demyelinating disease of the central nervous system in a human domestic animal, such as multiple sclerosis. animal, such as multiple sclerosis. or a

Claim 6; Fig 36; 159pp; English.

The invention relates to an antibody (I) produced by injecting an antibody, where the peptide comprises a human anti-1gM antibody fragment CC given in the specification, or active fragments. Also included are commandal (comprising administering a monoclonal antibody, or maxtures, monomers, active fragments, or recombinant antibodies derived from it, characterised by their ability to bind structures and cells within the CC (CNS, including oligodendrocytes), stimulating dhe proliferation of glial CC cells in CNS axons in a mammal (comprising administering a monoclonal antibody, or mixtures, monomers, active fragments, or recombinant antibodies derived from it, characterised by their ability to bind structures and cells within the CNS), treating a monoclonal antibody, or mixtures, monomers, active fragments, or recombinant compositional antibody, or mixtures, monomers, active fragments, or recombinant antibodies derived from it, characterised by their ability to bind structures and cells within the CNS), and to stimulate remyelination of demyelinating attribudy, or mixtures, monomers, active fragments, or recombinant antibody, or mixtures, monomers, active fragments, or composition of the CNS), stimulating remyelination of CNS axons in a mammal (comprising administering a compositional antibody, or mixtures, monomers, active fragments or compositional antibody, or mixtures, monomers, active fragments of the cNS axons in a mammal (compositional antibody), an asset of the cNS, and to stimulate remyelination of GNS axons in a mixture, the proliferation of Spial antibody, an antibody and antibody

in gene mapping. New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

Claim 27; Page; 190pp; English

The invention relates to novel diagnostic and therapeutic polynucleotides conserved from one of the 2722 sequences defined in the specification. A CC polynucleotide of the invention may have a use in gene therapy. The human CC diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated CC with human molecules, e.g. cell proliferative disorder, endocrine autoimmune/inflammatory disorders, developmental disorders, or clinections caused by virus, bacteria, fungi or parasite. The dithp cm collecules may also be used in genetic mapping, in identifying individuals cc from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline cc polymorphisms, as molecular weight markers, and for somatic or germline cc invention. Note: The sequence represents a dithp protein of the constitution. The present sequence represents is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a reagent comprising an IgG anti-Rh antibody chaving two lambda light chains, two gamma 3 heavy chains and a polymeric tailpiece attached to the carboxy terminal end of the heavy chain. The reagent is useful in a haemagglutinin test to determine the presence of one or more Rh (rhesus) antigens on red blood cells. The reagent is also useful for testing red blood cells to determine the presence of one or more Rh factors, by contacting red blood cells with the reagent for a sufficient time and at a sufficient temperature to cause agglutination of red blood cells which have one or more Rh factors present, and determining whether the red blood cells agglutinate to determine the presence of one or more Rh factors present, and accurate Rh phenotyping of blood and is used in the one-step haemagglutinin method. This sequence represents a human IgG anti-Rh antibody lambda collight chain polypeptide
                                                                                                                                                                                                                                                                                                                                             Query Match

The single chain framework, antibody or antibody fragment, is useful in target validation, diagnostic applications, library construction or therapeutic applications. The framework sequences are used in the identification of a conserved framework residue class selected from polar but uncharged R groups, positively charged R groups, negatively charged R groups, negatively charged R groups, negatively charged R groups, and special amino acids. The framework sequences may also be used in the identification of at least one conserved framework sequence, where the conserved framework sequence is 2 -5, 5-10 or 10-25 residues, and where the conserved framework sequence has gaps. The nucleic acid molecule is used in gene therapy. The present sequence is a polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 111 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New single chain immunoglobulin frameworks that demonstrate enhanced stability in the intracellular environment, useful for target validates
